Segmental box girder bridges externally post-tensioned are one of the major new developments in bridge engineering in the last years. In contrast to 'classical' monolithic constructions a segmental bridge consists of (small) precast elements stressed together by external tendons (fig. 1). The many advantages of this type of

completed bridge and used again to erect the eastbound structure. Each bridge is an 11-span, continuous unit consisting of 244 constant depth precast concrete box girder segments. Typical span lengths are 245 ft (75 m); non-typical spans range from 177 ft 6 in. (54 m) at the west abutment to 275 ft (84 m) at Spans 8 and 9 on the east end

11.2 Balanced Cantilever Girder Bridges 11.2.1 Overview Balanced cantilever segmental construction for concrete box-girder bridges has long been recognized as one of the most efficient methods of building bridges without the need for falsework. This method has great advantages over other forms of construction in urban areas where temporary shoring

Precast segmental deck construction is used for long bridges where the deck depth is difficult for cast in situ construction. Box girder deck segments are generally used where the segment can be 2m or less deep, between 2.5m and 4m long carrying a deck upto 15m wide are generally used.

Precast Segmental Bridge Construction - CalMatters

A segmental bridge is a bridge built in short sections, i.e., one piece at a time, as opposed to traditional methods that build a bridge in very large sections. The bridge is made of concrete that is either cast-in-place or precast concrete. These bridges are very economical for long spans, especially when access to the construction site is restricted. They are also chosen for their aesthetic appeal.

Segmental bridge - Wikipedia

Precast struts and transverse trusses are sometimes combined in cable-stayed bridges with one central plane of stay cables supporting twin precast segmental box girders, while they are rarely necessary with twin box girders supported at the edges with two planes of stay cables. Precast segmental technology, however, is rarely applied to modern cable-stayed bridges designed for long service life because of the weight of these structures and the huge number of longitudinal and transverse ...

precast concrete. Depending on the span length and type of application, a precast element can be prestressed or nonprestressed, The largest precast elements used in bridges are prestressed box girder seg-ments. An Overview of Precast Prestressed Segmental Bridges

Balanced cantilever construction is suited to precast and cast-in-place segmental bridges. Precast segmental construction is addressed to large-scale bridge projects with 50:120-m spans; ground cranes and lifting frames handle the segments with free erection sequences, while self-launching gantries operate linearly from abutment to abutment.
