This book gives a comprehensive overview of the physical properties of charged particles in solutions and suspension. Selected experimental techniques, theoretical models, and three basic shapes 1/m spheres, rods, and coils 1/m are studied. A major emphasis of this book is the role of the dynamics and distribution of the electrolyte ions in the determination of the physical properties of the macroionic solutions and suspensions. Combining a solid theoretical foundation with clear and comprehensive discussions addressed to experimentalists, this book will be of great interest to research scientists in physical chemistry, colloid chemistry, biophysics, biochemistry, and biochemical engineering.

A general and introductory survey of foams, emulsions and cellular materials. Foams and emulsions are illustrations of some fundamental concepts in statistical thermodynamics, rheology, elasticity and the physics and chemistry of divided media and interfaces. They also give rise to some of the most beautiful geometrical shapes and tilings, ordered or disordered. The chapters are grouped into sections having fairly loose boundaries. Each chapter is intelligible alone, but cross referencing means that the few concepts that may not be familiar to the reader can be found in other chapters in the book. Audience: Research students, researchers and teachers in physics, physical chemistry, materials science, mechanical engineering and geometry.

This book provides a review of the current understanding of the behavior of non-spherical particle suspensions providing experimental results, rheological models and numerical modeling. In recent years, new models have been developed for suspension rheology and as a result applications for nanocomposites have increased. The authors tackle issues within experimental, model and numerical simulations of the behavior of particle suspensions. Applications of non-spherical particle suspension rheology are widespread and can be found in organic matrix composites, nanocomposites, biocomposites, fiber-filled fresh concrete flow, blood and biologic fluids. Understand how to model and predict the final microstructure and properties of particle suspensions Explores nano, micro, meso and macro scales Rheology, thermomechanical and electromagnetic physics are discussed
